### Description

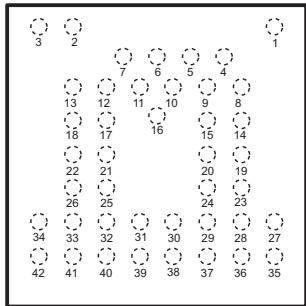

The HV2605 and HV2705 are 16-channel low harmonic distortion high-voltage analog switch integrated circuits (ICs). These devices are designed for applications requiring high-voltage switching controlled by low-voltage control signals, such as medical ultrasound imaging and other piezoelectric transducer drivers. The HV2705 has integrated bleed resistors which eliminate voltage build-up on capacitive loads such as piezoelectric transducers.

These ICs shift input data into a 16-bit Shift register that can then be retained in a 16-bit latch. To reduce any possible clock feed-through noise, the latch enable bar should be left high until all bits are clocked in. Data are clocked in during the rising edge of the clock. This device combines high-voltage, bilateral DMOS switches and low-power CMOS logic to provide efficient control of high-voltage analog signals.

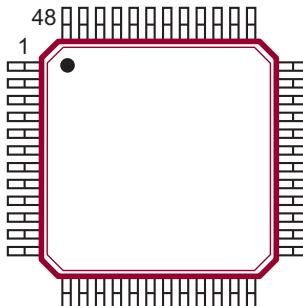

The device is suitable for various combinations of high-voltage supplies, e.g.,  $V_{PP}/V_{NN}$ : +40V/-160V, +100V/-100V and +160V/-40V.

**Note 1:** The 16 switches operate independently.

**2:** Serial data is clocked in on the low-to-high transition of the clock.

**3:** All 16 switches go to a state retaining their latched condition at the rising edge of  $\overline{LE}$ . When  $\overline{LE}$  is low, the Shift registers data flow through the latch.

**4:**  $D_{OUT}$  is high when data in the Shift register 15 is high.

**5:** Shift registers clocking has no effect on the switch states if  $\overline{LE}$  is high.

**6:** The CLR clear input overrides all other inputs.

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
