N-Channel UltraFET® MOSFETs 60V, 64A, 16mΩ

General Description

These N-Channel power MOSFETs are manufactured using the innovative UltraFET® process. This advanced process technology achieves very low on-resistance per silicon area, resulting in outstanding performance. This device is capable of withstanding high energy in the avalanche mode and the diode exhibits very low reverse recovery time and stored charge. It was designed for use in applications where power efficiency is important, such as switching regulators, switching convertors, motor drivers, relay drivers, low-voltage bus switches, and power management in portable and battery-operated products.

Applications

- Motor and Load Control
- Powertrain Management

Features

- 175°C Maximum Junction Temperature
- UIS Capability (Single Pulse and Repetitive Pulse)
- Ultra-Low On-Resistance $r_{DS(ON)} = 0.016\Omega$, $V_{GS} = 10V$

MOSFET Maximum Ratings $T_C = 25^\circ C$ unless otherwise noted

| Symbol | Parameter | Ratings | Units |
|-------------------|--|------------|----------------------|
| V_{DSS} | Drain to Source Voltage | 60 | V |
| V_{GS} | Gate to Source Voltage | ± 20 | V |
| I_D | Drain Current Continuous ($T_C = 25^\circ C$, $V_{GS} = 10V$) | 64 | A |
| | Continuous ($T_C = 125^\circ C$, $V_{GS} = 10V$, $R_{\theta JA} = 43^\circ C/W$) | 5 | A |
| | Pulsed | Figure 4 | A |
| E_{AS} | Single Pulse Avalanche Energy (Note 1) | 250 | mJ |
| P_D | Power dissipation | 150 | W |
| | Derate above $25^\circ C$ | 1 | $W/\text{ }^\circ C$ |
| T_J , T_{STG} | Operating and Storage Temperature | -55 to 175 | $^\circ C$ |

Thermal Characteristics

| | | | |
|-----------------|---|----|--------------|
| $R_{\theta JC}$ | Thermal Resistance Junction to Case TO-263 | 1 | $^\circ C/W$ |
| $R_{\theta JA}$ | Thermal Resistance Junction to Ambient TO-263 | 62 | $^\circ C/W$ |
| $R_{\theta JA}$ | Thermal Resistance Junction to Ambient TO-263, 1in ² copper pad area | 43 | $^\circ C/W$ |

This product has been designed to meet the extreme test conditions and environment demanded by the automotive industry. For a copy of the requirements, see AEC Q101 at: <http://www.aecouncil.com/>

Reliability data can be found at: <http://www.fairchildsemi.com/products/discrete/reliability/index.html>.

All Fairchild Semiconductor products are manufactured, assembled and tested under ISO9000 and QS9000 quality systems certification.

Thermal Resistance vs. Mounting Pad Area

The maximum rated junction temperature, T_{JM} , and the thermal resistance of the heat dissipating path determines the maximum allowable device power dissipation, P_{DM} , in an application. Therefore the application's ambient temperature, T_A ($^{\circ}\text{C}$), and thermal resistance $R_{\theta JA}$ ($^{\circ}\text{C/W}$) must be reviewed to ensure that T_{JM} is never exceeded. Equation 1 mathematically represents the relationship and serves as the basis for establishing the rating of the part.

$$P_{DM} = \frac{(T_{JM} - T_A)}{R_{\theta JA}} \quad (\text{EQ. 1})$$

In using surface mount devices such as the TO-263 package, the environment in which it is applied will have a significant influence on the part's current and maximum power dissipation ratings. Precise determination of P_{DM} is complex and influenced by many factors:

1. Mounting pad area onto which the device is attached and whether there is copper on one side or both sides of the board.
2. The number of copper layers and the thickness of the board.
3. The use of external heat sinks.
4. The use of thermal vias.
5. Air flow and board orientation.
6. For non steady state applications, the pulse width, the duty cycle and the transient thermal response of the part, the board and the environment they are in.

Fairchild provides thermal information to assist the designer's preliminary application evaluation. Figure 20 defines the $R_{\theta JA}$ for the device as a function of the top copper (component side) area. This is for a horizontally positioned FR-4 board with 1oz copper after 1000 seconds of steady state power with no air flow. This graph provides the necessary information for calculation of the steady state junction temperature or power dissipation. Pulse applications can be evaluated using the Fairchild device Spice thermal model or manually utilizing the normalized maximum transient thermal impedance curve.

Thermal resistances corresponding to other copper areas can be obtained from Figure 20 or by calculation using Equation 2. The area, in square inches is the top copper area including the gate and source pads.

$$R_{\theta JA} = 26.51 + \frac{19.84}{(0.268 + Area)} \quad (\text{EQ. 2})$$
